

Screening Test Report

The outcome presented here should not be construed as a definitive diagnosis of dyslexia but rather as a collection of metrics and indicators that may suggest certain traits or characteristics associated with dyslexia. These metrics serve as a preliminary evaluation, highlighting areas that could align with dyslexic tendencies or patterns. It's essential to recognize that a comprehensive diagnosis of dyslexia involves a thorough assessment by qualified professionals, incorporating various tests, observations, and considerations beyond the scope of these metrics. These metrics serve as a starting point, indicating areas warranting further investigation or specialized evaluation by experts in the field of learning differences. Understanding and interpreting these metrics in conjunction with a formal assessment is crucial to accurately determine the presence of dyslexia or related conditions.

- User has Dyslexia
- Alphabetic Awareness Problems
- Visualization Problems
